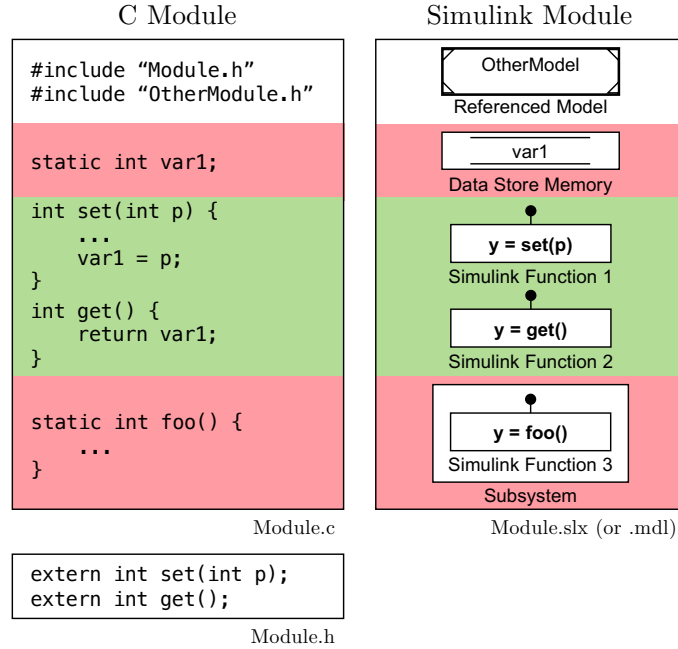

Figure 1: Simulink module structure based on C.

1 Introduction

The Simulink Module Tool performs several functions in order to support modular development for Simulink models. A Simulink module structure can be summarized by Figure 1. This tool helps in scoping **Simulink Functions**, displaying interfaces, and checking associated guidelines. The following sections explain each of the tool functions.

1.1 Simulink Functions

In Simulink, a function can be defined via the **Simulink Function** block, and invoked graphically via **Function Caller** blocks. In the modular programming approach to software development, a system is decomposed into modules. Each module must be able to hide information in its implementation, and only expose on the interface information what is to be shared with other modules. One can use **Simulink Function** blocks to selectively hide or expose elements on the interface. However, a thorough understanding of the **Simulink Function** block is necessary in order to know how the *Function Visibility* parameter and location in the model impacts its accessibility and name qualification.

The Simulink Module Tool assists developers with using **Simulink Function** blocks in implementing Simulink modules. The tool can automatically convert between the different scopes of **Simulink Functions**, thereby changing whether it

is exposed on the interface or local to the model. The tool also assists users in quickly calling **Simulink Functions**, with their appropriate qualifiers, from any location in a model or parent hierarchy, as well as creating **Function Caller** blocks with their *Function prototype*, *Input argument specifications*, and *Output argument specifications* parameters automatically populated (if possible).

1.2 Interfaces

A Simulink model's interface is commonly considered to be comprised of the **Inports** and **Outports** of the top-level system. A module interface should make clear *all* the communication of a module. The **From File**, **From Spreadsheet**, **From Workspace** blocks, and global **Data Stores** that are read are also inputs to the model. Elements that are outputs of the model can also include **To Workspace**, **To File**, and global **Data Stores** that are written to. Additionally, **Simulink Function** definitions can be exported from a model.

The Simulink Module Tool automatically extracts the interface of a Simulink module and either represents it in the the root of the Simulink module, or prints the interface to the Command Window.

1.3 Dependencies

A Simulink model can have many dependencies in the form of **Model References**, **Library** linked blocks, and data dictionaries. These reside outside of the Simulink module, but are necessary in order to be able to simulate and code generate the model.

The Simulink Module Tool examines the model, determines which dependencies exist, and prints a list to the Command Window.

1.4 Guidelines

Guidelines relating to **Simulink Functions** and interfaces are presented in [1]. Tables 1, 2, 3, and 4 outline the guidelines, and the tool automates the checking of these guidelines.

2 How to Use the Tool

This section describes what must be done to setup the Simulink Module Tool, as well as how to use the tool.

2.1 Prerequisites and Installation

1. For full use of the tool, please use MATLAB/Simulink R2017b or newer.¹
2. To install the tool,
 - (a) from a `.zip` file — unzip the contents into your desired location. Ensure the unzipped folder and subfolders are present in your MATLAB search path, or add them if they are not present. Run [sl_refresh_customizations](#) to refresh the Context Menu.
 - (b) from a `.mltbx` file — simply open MATLAB and double-click on the file. Your MATLAB search path should be automatically configured.
 - (c) from the files only — add the folders and subfolders to your MATLAB search path. Run [sl_refresh_customizations](#) to refresh the Context Menu.
 - *Note:* If running the command “`which AutoLayout`” indicates that the script is not found, then the tool needs to be added to the MATLAB search path. For information on adding files to the MATLAB search path, please see the [MathWorks documentation](#).
3. Ensure the Simulink-Utility folder is on your MATLAB search path. This is a dependency for the tool to work correctly.
4. Ensure your model is open and unlocked.

2.2 Getting Started

The tool can be used via the Simulink Context Menu, which can be viewed by right-clicking in a model. The following options can be available, depending on what is selected in the model, and which version of MATLAB/Simulink is used. Options available when no blocks are selected are (Figure [2a](#)):

- *Call Function*
- *Check Guidelines*
- *Show Interface*
- *Print Interface*
- *Delete Interface*

¹Simulink functions were introduced in R2014b. The *Function Visibility* parameter was introduced in R2017b.

- *Print Dependencies*

Options available when one or more Simulink Function blocks are selected (Figure 2b):

- *Change Function Scope*
- *Create Function Caller*

Options available when a Subsystem block is selected (Figure 2c):

- *Convert Subsystem*

(a) Menu options when no Simulink Functions are selected.

(b) Menu options when one or more Simulink Functions are selected.

(c) Menu options when a Subsystem is selected.

Figure 2: Simulink Context Menu with context-dependant tool options visible.

2.3 Functionality

This section describes the tool functionality when it is used from the Simulink Context Menu (Figure 2).

2.3.1 Call Function

Note: This option is not available in versions prior to R2014b.

Right-clicking anywhere in the model and then selecting **Call Function** from the Context Menu will display the user interface shown in Figure 3. The listbox shows all **Simulink Functions** that can be called from that location in the model. Select a function, press OK, and a **Function Caller** will be created with its **Prototype**, **Input argument specifications**, and **Output argument specifications** parameters automatically populated.

This function automates the following manual steps:

1. Drag and drop a **Simulink Function** block from the User-Defined Functions library into the model.
2. Open the **Simulink Function** block parameters.
3. Enter a **Prototype** from those available.
4. Determine the input and output types and dimensions. Enter them into the **Input argument specifications** and **Output argument specifications** fields in the appropriate formatting.

Moreover, it allows you to see which **Simulink Functions** are available (i.e., in scope) from any location in the model.

2.3.2 Change Function Scope

Note: This option is not available in versions prior to R2017b.

Right-clicking directly on one or more **Simulink Function** blocks and then selecting **Change Function Scope** from the Context Menu, will display options for changing the scope of the functions. An example is shown in Figure 4.

The scope of a **Simulink function**, i.e., where it can be used, is determined by both its hierarchal *placement* in the model in which it is defined, and its *Function Visibility* parameter. The rules for determining the scope of a **Simulink Function** are not straightforward. When a **Simulink Function** is given global function visibility, it can be placed anywhere in a model, and will be available for use anywhere in the model hierarchy (i.e., in any subsystems or in the parent model hierarchy). When a **Simulink Function** is given scoped function visibility, its placement in the model affects its accessibility. If placed at root level, it is accessible in the model hierarchy. The difference between a global **Simulink Function** and a scoped **Simulink Function** placed at the root is in the way it is called. In the latter, the function name must be qualified with the model reference block name. If the scoped **Simulink Function** is placed in a subsystem S (i.e., not at the root), it is no longer available outside of the model. Instead, it is available in the parent subsystem of S and any descendants.

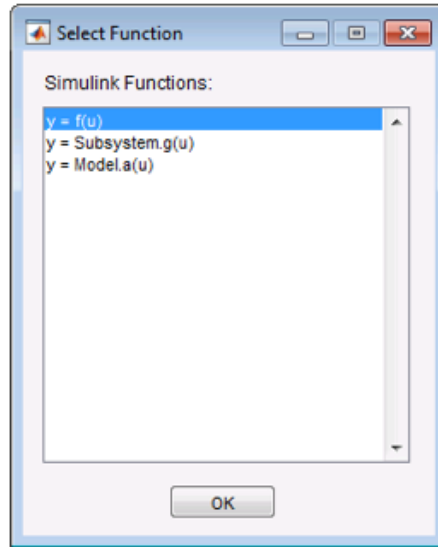

Figure 3: Select Function interface.

2.3.3 Create Function Caller

Note: This option is not available in versions prior to R2014b.

Right-clicking on one or more Simulink Function blocks and then selecting **Create Function Caller** from the Context Menu, will automatically create corresponding Function Caller blocks for the selected functions. The **Prototype**, **Input argument specifications**, and **Output argument specifications** parameters of the new Function Caller are automatically populated. An example is shown in Figure 5a.

2.3.4 Convert Subsystem

Note: This option is not available in versions prior to R2014a.

Right-clicking on a Subsystem and then selecting **Convert Subsystem**, and one of the two option from the Context Menu will convert a Subsystem block into a Simulink Function. This will prompt the user for a function name, and perform several functions to reconfigure the Subsystem. This includes converting any Inport/Outport blocks to ArgIn/ArgOut blocks, adding a Trigger block, and setting various parameters.

2.3.5 Check Guidelines

Right-clicking anywhere in the model and then selecting **Check Guidelines** from the Context Menu will display the user interface shown in Figure 6. The window shows all the guidelines that can be enabled by the user, and hovering

Figure 4: Changing Simulink Function scopes.

over their names with the cursor will display a brief description of the guideline. The guidelines are detailed in Tables 1, 2, 3, and 4. Select one or more guidelines to check, press OK, and the Command Window will display any violations.

2.3.6 Show Interface and Print Interface

Note: This option is not available in versions prior to R2016a.

Right-clicking anywhere in the model and then hovering over **Show Interface** or **Print Interface** from the Context Menu will give the user options to insert the interface representation in the model (e.g., Figure 7a), or print the interface description to the Command Window (e.g., Figure 7b).

2.3.7 Delete Interface

Right-clicking anywhere in the model and then selecting **Delete Interface** will delete the interface that was created using the **Show Interface** option.

Table 1: Guideline on Simulink Function placement.

ID: Title	1: Simulink Function Placement
Priority	Strongly Recommended
MATLAB Version	R2014b and later
Description	Position the Simulink Function block in the lowest common parent of its corresponding Function Caller blocks. Do not position the Simulink Function in the top layer for no reason. Avoid placing Simulink Function blocks below their corresponding Function Caller blocks.
Rationale	<input checked="" type="checkbox"/> Readability <input checked="" type="checkbox"/> Verification and Validation <input checked="" type="checkbox"/> Workflow <input checked="" type="checkbox"/> Code Generation <input type="checkbox"/> Simulation

Table 2: Guideline on Simulink Function visibility.

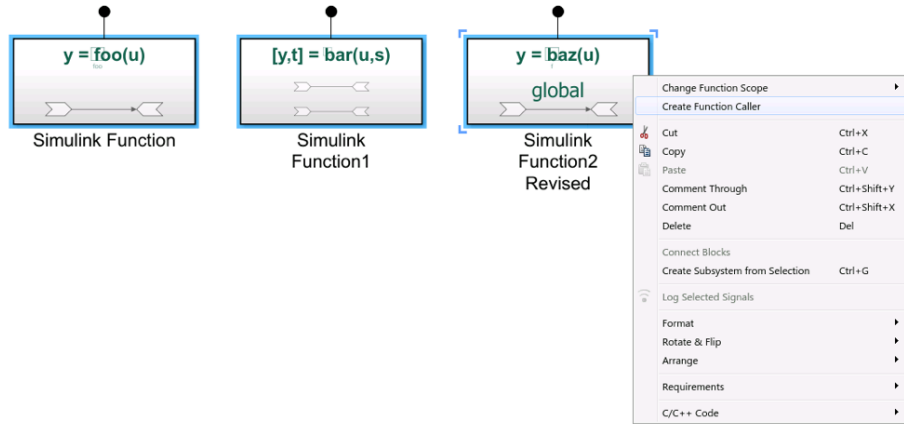

ID: Title	2: Simulink Function Visibility
Priority	Strongly Recommended
MATLAB Version	R2017b and later
Description	Limit the Function Visibility parameter of the Simulink Function block's trigger port to scoped if possible. 
Rationale	<input checked="" type="checkbox"/> Readability <input checked="" type="checkbox"/> Verification and Validation <input checked="" type="checkbox"/> Workflow <input checked="" type="checkbox"/> Code Generation <input type="checkbox"/> Simulation

Table 3: Guideline on Simulink Function shadowing.

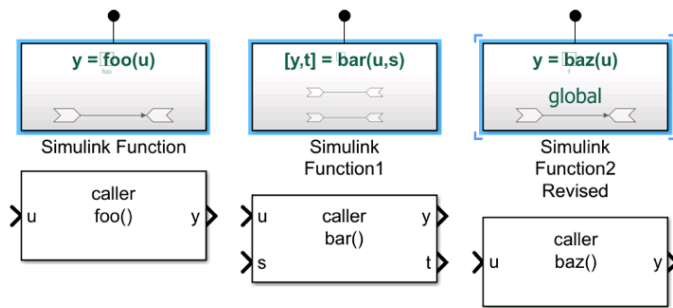

ID: Title	3: Simulink Function Shadowing
Priority	Strongly Recommended
MATLAB Version	R2014b and later
Description	Do not place Simulink Functions with the same name and input/output arguments within each other's scope.
Rationale	<input checked="" type="checkbox"/> Readability <input checked="" type="checkbox"/> Verification and Validation <input checked="" type="checkbox"/> Workflow <input type="checkbox"/> Code Generation <input type="checkbox"/> Simulation

Table 4: Guideline on using the base workspace.

ID: Title	4: Use of the Base Workspace
Priority	Recommended
MATLAB Version	R2006a and later
Description	<p>Do not use the base workspace for storing, reading, or writing data that a model is dependant on. Instead, place such data in either the model workspace, if it is to be used in a single model, or a data dictionary if it is to be shared across models. This means avoiding the use of the sources,</p> <ul style="list-style-type: none"> • From File • From Workspace • From Spreadsheet <p>and sinks,</p> <ul style="list-style-type: none"> • To File • To Workspace <p>as well as avoiding defining signals, types, etc. in the base workspace.</p>
Rationale	<ul style="list-style-type: none"> ☑ Readability ☑ Verification and Validation ☑ Workflow ☑ Code Generation ☑ Simulation

(a) Select Create Function Caller from the Context Menu.

(b) New function callers are added.

Figure 5: Example of Simulink Function Caller creation.

2.3.8 Print Dependencies

Right-clicking anywhere in the model and then selecting **Print Dependencies** from the Context Menus will print the dependencies that the model relies on in the Command Window. Dependencies include: **Model Reference** blocks, **Library** blocks, and data dictionaries. An example of the output is shown in Figure 8.

2.4 Errors and Warnings

Any errors or warnings during tool use will be visible in the MATLAB Command Window or as pop-up windows.

1. If a Simulink Function is moved and one or more Function Callers with the same prototype exist within its previous scope, a warning will appear in the Command Window. It is recommended that the user ensure all Func-

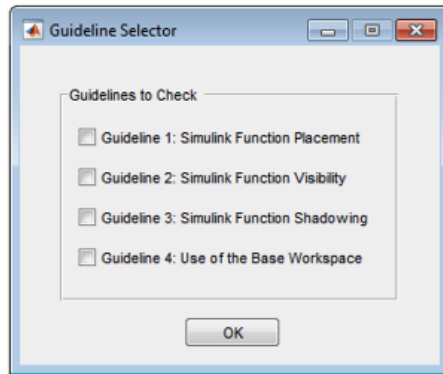

Figure 6: Select guidelines GUI.

tion Callers still correctly call the Simulink Function. Automatic updating of Function Caller blocks is planned for a future version of this tool.

2.5 Limitations

A Simulink model can depend on or interact with other files and elements via the use of Callbacks² and S-Functions³. Identifying these is not currently supported by the tool.
